Key takeaways

Key Takeaways

Mobile Audience Dynamics Vary from Market to Market

While mobile now accounts for the majority of time spent across nearly every market, the extent to which different countries rely on mobile vs. desktop varies considerably. Some markets are dominated heavily by mobile-only internet users, while multi-platform internet usage is the norm in others.

Mobile Usage Time Dominated by a Few Content Categories

Social networking, entertainment and gaming are universally the biggest drivers of overall mobile time, but there is still value across many other categories that are important functions, offer marketing touchpoints or drive transactions.

Comfort with Mobile Transactions Can Unlock Growth for Multiple Categories

Trust and user experience are traditional barriers to m-commerce, and it there is a natural link between users who make retail purchases on mobile devices, and other transactions. Improving confidence and usability can allow transactional categories to truly benefit from an already-enlarged mobile share of time.

Mobile App Usage is Highly Concentrated Within the Leading Apps

Consumers spend more than 95% of their app time on their 10 most regularly used apps, often drawn from a relatively short list of top overall apps that contribute the majority of app time spent and are most likely to be found on users' home screens.

The Mobile Marketplace is Showing Signs of Maturity

Apps' share of overall digital time has plateaued in many markets over the last year. As downloading of new apps begins to stall while usage concentrates among the leaders, the opportunity to disrupt the local or global market is a growing challenge.
